Customer Master Workbench — Master Data team guide

The Workbench is the Master Data team's tool. The business submits requests in the **AXIOM Customer Request Portal**; the Workbench is where you review them, download the form for TOPdesk and track your work. Requesters never use the Workbench. Communication with them and the official ticket history stay in **TOPdesk**.

How a request reaches you

1. A requester submits a Create, Extend or Change request in the portal.
2. The portal assigns it to an active team member for that Company Code + Sales Org (Assignment_Pool in `assignment_rules.xlsx`) and stores it for the Workbench with status **Needs review**.
3. You receive a **Teams message**. Its last line is a direct link that opens exactly that request in the Workbench.
4. The requester receives a confirmation email with the reference number (no Workbench link).

The request list

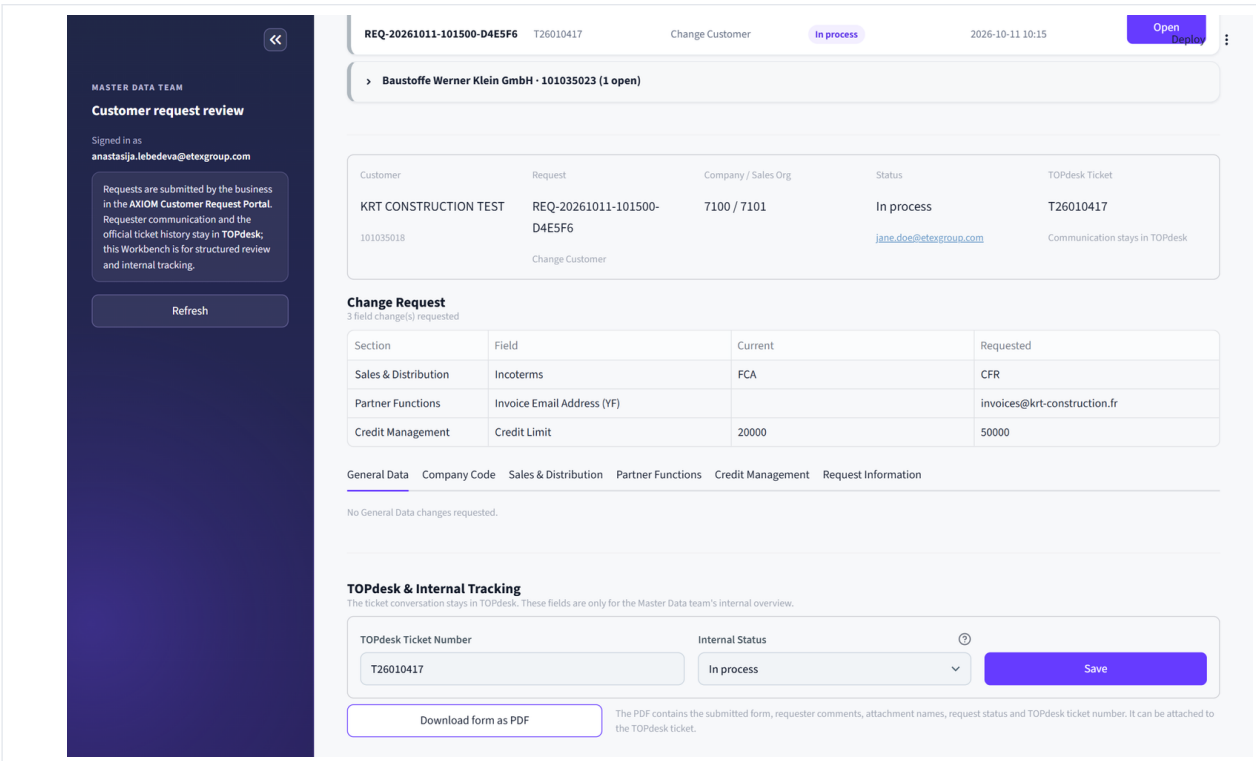

Requests grouped by customer, with TOPdesk ticket, type, status and last update.

- Requests are grouped **per customer**; the group title shows how many are still open. Open requests come first, ordered by status.
- **Search** finds customers, customer IDs, request IDs, TOPdesk tickets and text inside the form.
- Completed requests are hidden until you tick **Show completed**.
- **Open** shows a request below the list; the selected request's button turns purple. The browser address now contains the request, so you can share or bookmark the link.

Status	Meaning
Needs review	New, not started.
In process	You are working on it in SAP.
Waiting for requester	You asked the requester for information in TOPdesk.
On hold	Paused internally (for example waiting for another team).
Completed	Done; hidden from the default list.

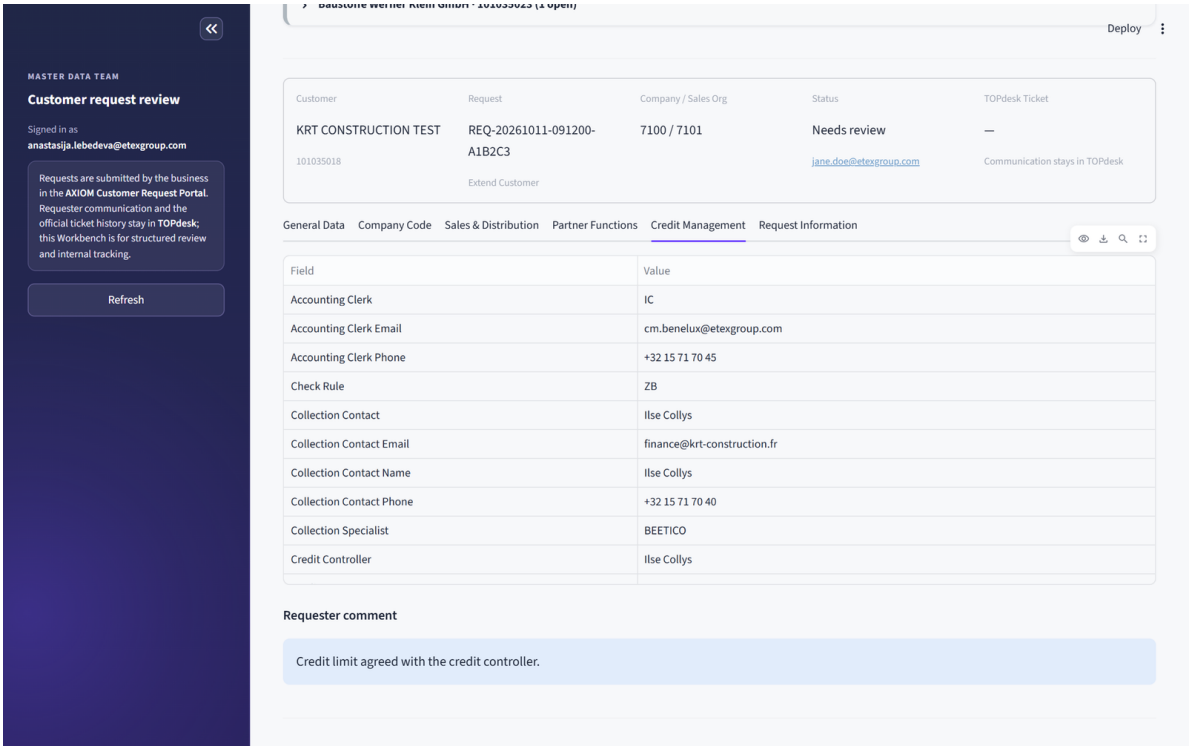

Reviewing a request

The summary card shows the customer, request ID and type, Company Code / Sales Org, status, the requester and the TOPdesk ticket.

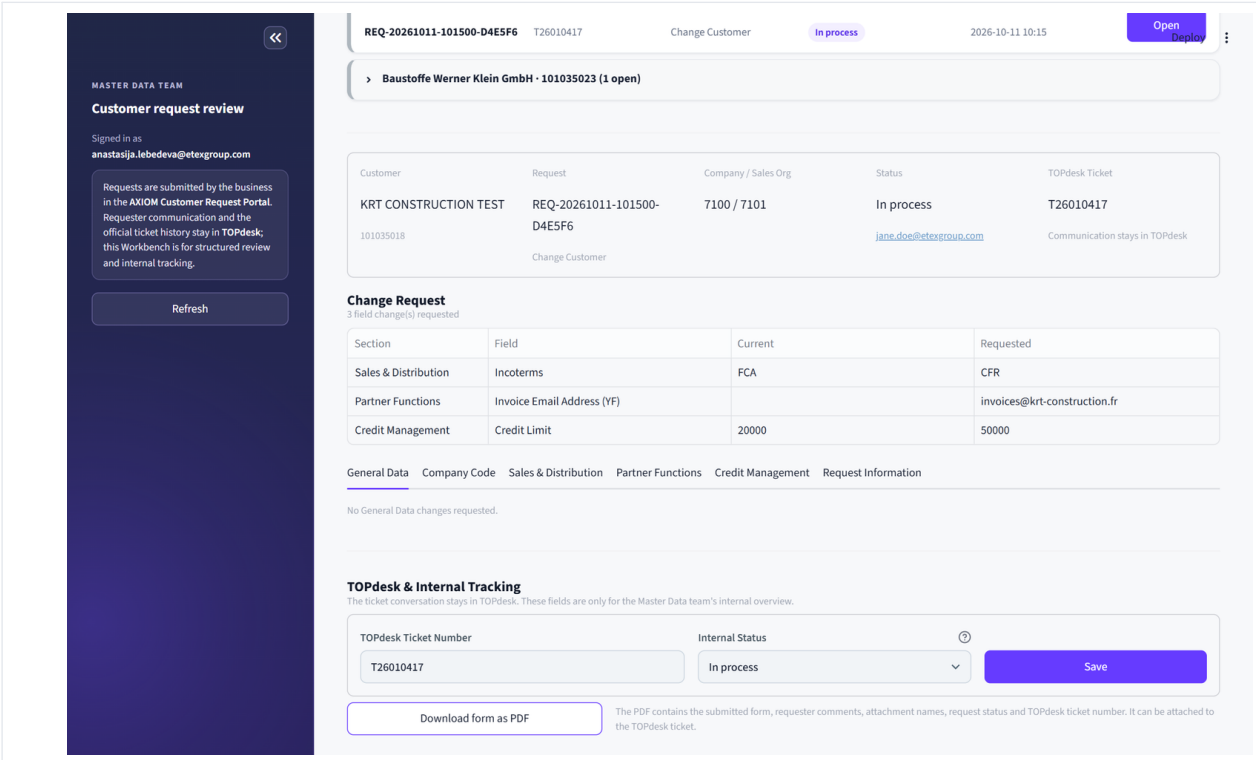

A Change request opened from the Teams link: summary card and the requested changes with current and requested values.

- **Change requests** start with **Change Request**: one row per field with its section, the **current** value and the **requested** value. Only the fields the requester picked are included.
- **Create / Extend requests** show every submitted value. For **Create** the Company Code is the customer's own Company Code from SAP (the requester cannot change it). Tick-box fields such as **Pricing** arrive as X (ticked) or empty (not ticked). All request types have tabs per section: General Data (current vs requested), Company Code, Sales & Distribution, Partner Functions, Credit Management and Request Information.
- **Requester comment** boxes under a tab hold the requester's instructions for that section.
- **Attachments** (when present) can be downloaded one by one.
- **Activity** (expander at the bottom) lists ticket and status changes made in the Workbench.

Extend request, Credit Management tab, with the requester's comment.

TOPdesk and internal tracking

TOPdesk ticket number, internal status, Save and the PDF download.

1. Create or find the TOPdesk ticket and enter its number in **TOPdesk Ticket Number**.
2. Set the **Internal Status** (see the table above).
3. Press **Save**. Each change is recorded under Activity with your name.
4. **Download form as PDF** creates a printable summary (submitted form, comments, attachment names, status and ticket number) to attach to the TOPdesk ticket. Change requests include the *Requested Changes* table.

Daily routine

When	Do
Teams message arrives	Open the link, review, enter the TOPdesk ticket, set **In process**.
Information is missing	Ask the requester in TOPdesk, set **Waiting for requester**.
Blocked by someone else	Set **On hold** and add the reason in TOPdesk.
Done in SAP	Set **Completed**; attach the PDF to the TOPdesk ticket.
Start of day	Clear the search and work through **Needs review**, oldest first.

When something looks wrong

Situation	Cause and action
"Request … is not in the Workbench yet"	The link points to a request the Workbench cannot find. While the portal runs in demo mode its requests are stored locally, so Teams links show this message until the portal writes to the Workbench table.
The list is empty	Check the search box and **Show completed**; press **Refresh** in the sidebar.
"No forwarded Databricks user token"	The Workbench app needs the **sql** User Authorization scope in Databricks Apps; ask the app owner.
Requests go to the wrong person	Adjust `Members` / `Assignment_Pool` in `assignment_rules.xlsx`.
Wrong fields, defaults or dropdown values in the portal	Maintain the portal's rule workbooks; see the separate guide **Maintaining the rule files in data/** (`data_rules_guide.pdf`).
